

Data Centre Optimisation

Telehouse has partnered with EkkoSense to apply an ongoing programme of cooling and airflow optimisation.

Our goal is to secure continuous performance improvements in this and our other data centres to increase visibility, efficiency and resilience.

The Programme:

- 1** We will attach thermal sensors on all our rack doors and cooling systems, capturing accurate and continuous thermal data which feeds into EkkoSense's unique visualisation software to provide true 24/7 data centre monitoring.
- 2** Cooling and airflow across our sites will then be regularly optimised to maintain an ideal environment. This will include floor grille locations & cooling set points.

If you have any questions, please contact the Telehouse data centre management team.
